

Firmafill

Firmafill is a combination of high-quality excipients designed to take unnecessary research out of capsuling to save time and money. With Firmafill, you won't have to measure and mix fillers or flow agents, and there are no ratios to calculate. LFA has put everything we have learned over the last 10 years into Firmafill so that pharmaceutical-grade capsules can be produced right away.

Firmafill solves several capsuling problems, such as ensuring that each capsule has the same amount of active ingredient, allowing you to conduct testing to scientific levels of accuracy, and preventing granules and powders from sticking together.

The excipients included in the mix are microcrystalline cellulose, magnesium stearate, silicon dioxide, and dicalcium phosphate, which all provide unique benefits to a capsuling mix and remedy flowing issues. Firmafill takes care of the technicalities of capsule powder mixing, leaving the focus on production and business growth.

Main Benefits of Firmafill

- **Saves Money** - Firmafill solves a lot of expensive capsuling problems and is guaranteed to work with 99% of active ingredients and comes at a fraction of the price required to develop formulas.
- **Convenient** - Instead of depending on several suppliers for excipients, Firmafill can be ordered on our website in seconds. It is in stock at all times in LFA's UK, US, and Taiwan offices and can be dispatched same or next working day so production can keep going.
- **Saves Time** - When it comes to product development, resources are often limited which can result in spending too much time struggling to perfect a formula.

Specifications

Appearance	White
Physical state	Solid
Storage	Store at room temperature
Directly compressible	Yes
Bulk density	0.53 g/cm ³
